Host Sign Configuration - Admin Guide - SalesForce Connector

In the forthcoming guide, we will delve into the steps necessary to configure settings to enable opening the page in an IFrame. Specifically, it will detail the process of modifying the XML value to whitelist the desired URL. ensuring seamless integration and and accessibility within the IFrame.

To configure your eSAW instance to sign envelopes directly in Salesforce connector, you have to whitelist the url used to sign the document in IFrame following these steps:

• Download the configuration.zip:

- Unzip the downloaded configuration.zip file
- Update the global_variables.xml by changing the value which is shown in the next figure:

Figure	Description
<pre>(dai version*1,8* encoding="ut=4"); (-1-statution tigenty times there configuration versions contained for configuration versions configuration to the configuration version configuration to the configuration t</pre>	1. Update the "ContentSecurityPolicy" variable in global_variable xml file (replace 'https: /demo.esignanywhere.ne with your target eSAW instance)

- Zip the content of the unzipped folder
- · Upload the new created zip file in eSAW
