

Stamp Imprint Configuration

With custom signature rendering layout configuration (stamp imprint configuration or <SignatureRenderingLayoutConfiguration>), an organization administrator can define how the stamp imprint on the signature image looks like (e.g. fonts, elements, layout etc). The new functionality allows to set organization wide background images (e.g. company logos) or define specific fonts for text added to the stamp imprint. While it has no impact on the legal levels of signatures (in EU, defined by eIDAS), a customer specific stamp imprint representation can create higher subjective trust and contract awareness of your customers.

 - Example Configuration with the script-like name printed just on a line
 - Example Configuration with a graphical frame on the left-side
 - Graphical Table with Company Logo

Preconditions

Please note the following: The feature flag UseCustomStampImprintConfiguration is necessary.

v 21.16

This is a non-default feature of eSignAnyWhere. If you are interested in this optional feature please [contact us](#).

If the feature is activated for your organization you can find the setting in the organization settings. Please see the next figure:

The screenshot shows the eSign AnyWhere settings interface. On the left, there's a sidebar with navigation links: HOME, DOCUMENTS, TEMPLATES, CLIPBOARD, and SETTINGS. The SETTINGS section is expanded, showing sub-options: Account, Notifications, Address Book, Roles and Permissions, API Tokens and Apps, Organization (which is selected), Identity Providers, Licensing, Users, Team, Notification Templates, Agreements Configuration, Envelope History, and Errors. At the bottom of the sidebar, it says "eSignAnyWhere v23.4.E.0.518 © 2023 Nomial Group Term of use | Privacy | API".

Policy for the document viewer for recipients

- Document viewer policy: UPLOAD POLICY, RESET TO DEFAULT, DOWNLOAD CURRENT POLICY, DOWNLOAD POLICY TEMPLATE.
- HTML5 Signatures: LTA, toggle switch (on).
- Biometric Signatures, SMS-OTP Signatures: LTA, toggle switch (on).
- Digital Remote Signatures, Disposable Certificate, Automatic Remote Signatures, LocalCertificate: LT, toggle switch (off).
- Audit Trail: LTA, toggle switch (on).
- SHOW INFO: button.

Signature Appearance

- Custom Signature Rendering Configuration: UPLOAD CONFIGURATION, RESET TO DEFAULT, DOWNLOAD CURRENT CONFIGURATION, DOWNLOAD DEFAULT TEMPLATE.
- Server URL: Server URL input field.
- User: User input field.
- Password: Password input field.
- Hash Algorithm: SHA-256 dropdown.

Retention Period

- Enable Retention Period of Organization Drafts and Envelopes: checkbox.

Backup

- DOWNLOAD button.
- AVAILABLE FOR THE NEXT 47H AND 35MIN message.

Notification Settings

- Sender appearance: Manuel Gierlinger via https://beta4.testlab.yzmo.com dropdown.

User Logout Redirect URL

- https://beta4.testlab.yzmo.com input field.

Default for: redirect url before sending a draft

- Enter your redirect url here ... input field.

Envelope Details Page

- Sender can copy Viewer link from Envelope Details page (if sender role grants required envelope permission) checkbox.

In the section "Signature Appearance" section (in older versions it was called "Custom Signature Rendering Configuration"), you can find the following settings:

- Upload your configuration
- Reset the signature rendering to default
- You can download the current configuration
- You can download the default template

How to configure your own Signature Appearance

If you download the default template (SignatureRenderingLayouts.custom.xml) you will see the following configuration:

```
//<?xml version="1.0" encoding="utf-8"?>
<SignatureRenderingLayoutConfiguration>
<Colors>
</Colors>
<Fonts>
</Fonts>
<Layouts>
</Layouts>
</SignatureRenderingLayoutConfiguration>
```

Please note the following before you start to customize: The customized layouts, fonts and colors defined in the configuration file will override possibly existing elements of the default configuration. Also a combination of the two variants is possible. In that case the following hierarchy will be used:

1. Customized configuration from Customization Service
2. Customized local configuration
3. Default configuration

In the next section you can find possible configuration options.

Configuration options

Colors

Supported parameters:

- Parameter "a": Alpha
- Parameter "r": Red
- Parameter "g": Green
- Parameter "b": Blue

Fonts

Supported parameters:

- Parameter "family": Font family
- Parameter "size": Size (pt)
- Parameter "bold"
- Parameter "italic"
- Parameter "underline"
- Parameter "color": The id of the referenced color

Layouts

A layout consists of 1-n layers (e.g. to support background images). There are three different layer types supported:

- Layer
- ExternalImageLayer
- ImageLayer

Supported parameters:

- Parameter "backgroundColor": The id of the referenced color
- Parameter "defaultFor": when used in WebUI or in an API integration where the layout is not explicitly selected by the integration code, the "defaultFor" parameter allows selecting which layout should be used. Values can be separated with semicolon (;).
 - Allowed values: Click2Sign;Draw2Sign;Type2Sign;BiometricSignature;RemoteSignature;LocalCertificateSignature;DisposableCertificate;OtpSignature;AutomaticRemoteSignature;SwissComOnDemandCertificate;PushTan;ATrust;BankId;GenericSigningPlugin"
 - Mind that it may be useful to define different layouts e.g. for BiometricSignature or Type2Sign signatures.

Integration

 Following integration is currently not available via APIv6. Please also see [Migrate REST API clients from v5 to v6](#) (Currently Non-Supported Functionality)

It is possible to add the layout to a signature field sent via api. Just add the parameter "ly" for layout in the "AllowedSignatureTypes" section. Please see the following sample:

```
"AllowedSignatureTypes": [
    {
        "AllowedCapturingMethod": "Click2Sign",
        "Ly": "default",
        "Id": "679dd763-1234-1234-1234-cb1ce13dac7e",
        "DiscriminatorType": "SigTypeClick2Sign",
        "Preferred": false,
        "StampImprintConfiguration": {
            "DisplayExtraInformation": true,
            "DisplayEmail": true,
            "DisplayIp": true,
            "DisplayName": true,
            "DisplaySignatureDate": true,
            "FontFamily": "Times New Roman",
            "FontSize": 11.0
        }
    }
],
```

Layer

A layer consists of 1-n rows. The rows of a layer are printed in the order defined in the configuration.

Supported parameters:

- Parameter "useTotalHeight": If set, the whole image height will be used for the imprint (75 % otherwise)
- Parameter "vAlign": Vertical alignment on signature imprint image
 - top, middle, bottom

Row

A row consists of 1-n cells. Supported parameters:

- Parameter "cellWidthMode"

- "auto" or not defined: Width will be calculated automatically like in the old rendering
 - Aligned with neighbor rows with the same setting & number of cells
- "fit-content": Width will be as required for the content (replaces "alignHeadings" from legacy rendering)

Cells

There are several different cell types supported:

- Text cells
 - TranslatedText: Translated text for captions (retrieved from WSC's translation file)
 - Additional parameter "key": References the corresponding translation unit in group "SignatureImageRendering"
 - Supports placeholders (see below)
 - TranslatedTextWithColon: Translated text for captions (retrieved from WSC's translation file) followed by a colon
 - Additional parameter "key": References the corresponding translation unit in group "SignatureImageRendering"
 - Supports placeholders (see below)
 - Text: Without translation, printed as-is
 - Supports placeholders (see below)

Data cells

Signatory

The name of the signer or the subject of the signing certificate (e.g. local certificate signing)

Suggested label translation key: lbl_stamp_signatory

Example:

```
<TranslatedTextWithColon key="lbl_stamp_signatory" font="bold" />
<Signatory font="default"/>
```

Firstname

The first name of the signer as specified in the receiver information

Example:

```
<Firstname font="default"/>
```

Lastname

The last name of the signer as specified in the receiver information

Example:

```
<Lastname font="default"/>
```

FirstnameLastname

The first name & the last name (separated by a blank) of the signer as specified in the receiver information

Example:

```
<FirstnameLastname font="default"/>
```

LastnameFirstname

The last name & the first name (separated by a blank) of the signer as specified in the receiver information

Example:

```
<LastnameFirstname font="default"/>
```

CertificateCommonName

The subject of the signing certificate (e.g. local certificate signing)

Example:

```
<CertificateCommonName font="default"/>
```

Email

The email address of the signer

Example:

```
<Email font="default"/>
```

Date/Time/DateTimeLocal

The signing date (local timezone)

Example:

```
<DateTime font="default"/>
```

Date/TimeUtc

The signing date (UTC)

Example:

```
<DateTimeUtc font="default"/>
```

IpAddress

The ip address of the signer

Example:

```
<IpAddress font="default"/>
```

PhoneNumber

The phone number of the signer

Example:

```
<PhoneNumber font="default"/>
```

TransactionId

The transaction id (e.g. SMS-OTP signing)

Example:

```
<TransactionId font="default"/>
```

TransactionToken

The transaction token (e.g. SMS-OTP signing)

Example:

```
<TransactionToken font="default"/>
```

Issuer

The issuer of the signing certificate (e.g. local certificate signing)

Example:

```
<Issuer font="default"/>
```

PersonalNumber

The personal number of the signer (e.g. BankID)

Example:

```
<PersonalNumber font="default"/>
```

Metadata

To add (typically integration specific) values contained in the metaDataXml field of the envelope.

- Uses XPath to select one element from
 - EnvelopeInformation
 - AdditionalClientWorkstepInformation
- Additional parameter "xPath": To reference the desired node element
- Additional parameter "attribute" (optional): To reference the desired node's attribute
- Will print the value of the referenced node or attribute

Example 1:

Assuming the MetaDataXml contains

```
<myMetaData>
  <Name>John Doe</Name>
  <CaseId>1234567</CaseId>
</myMetaData>
```

Then, the following block will work in the StampImprintConfiguration:

```
<Metadata xPath="AdditionalClientWorkstepInformation/Name" font="default" />
```

Example 2:

Assuming the MetaDataXml contains

```
<myMetaData name="John Doe">
  <CaseId>1234567</CaseId>
</myMetaData>
```

Then,

```
<Metadata xPath=". attribute="name" font="default" />
```

Custom

- Can be used to add custom data to the signature image (currently only supported when signing with a Generic Signing Plugin)
- Additional parameter "key": To reference the desired key/value pair

Example:

```
<Custom key="certholder_confirmed_name" font="default" />
```

Additional cells

- Image
 - Content: Base64 encoded image
 - Additional parameter "height": To enable adjusting the size (in relation to the text size)
 - Supported units: pt
 - Image will not be scaled up (maximum size is the original image size)
- Newline
- Metadatalist
 - Uses XPath to select multiple nodes from
 - EnvelopeInformation
 - AdditionalClientWorkstepInformation
 - Iterates over the elements found

Supported parameters:

- Parameter "width"
 - Supported units: %
 - If set, the specified "cellWidthMode" of the row will be overruled
- Parameter "hAlign": Horizontal alignment
 - left, right, center
- Parameter "renderIfEmpty"
 - Cell will be skipped otherwise (like in old rendering)
 - Allows more flexibility (e.g. table layout with two rows and two columns, but only the first row has a heading)

To allow even more flexibility, text cells (Text, TranslatedText, TranslatedTextWithColon) support the following placeholders which refer to the according data cell and will be replaced before rendering.

- ##Signatory##
- ##Firstname##
- ##Lastname##
- ##FirstnameLastname##
- ##LastnameFirstname##
- ##CertificateCommonName##
- ##Email##
- ##IpAddress##
- ##PhoneNumber##
- ##TransactionId##
- ##TransactionToken##
- ##Issuer##
- ##PersonalNumber##

Notes:

- In case a data value is not available (e.g. no phone number set) the placeholder will be simply removed (replaced by an empty string).
- In case an unknown placeholder (e.g. ##Phone##) is configured, this one will not be replaced or removed.
- Data cells which require additional parameters (e.g. DateTime, Metadata) are not supported.

Image Layer

An image layer contains a single image only which can be positioned accordingly and might be used as a background image.

The image will not be scaled up (maximum size is the original image size)

Supported parameters:

- Content: Base64 encoded image (mind that the implementation expects a Base64 data source (e.g. PNG) including Base64 padding)
- Parameter "hAlign": Horizontal alignment on signature imprint image
 - left, center, right
- Parameter "height": Used to calculate the size on the signature imprint image
 - Can only be set in case "width" is not defined
 - Supported units: %

Parameter "width": Used to calculate the size on the signature imprint image

- Can only be set in case "height" is not defined
- Supported units: %

ExternalImageLayer

An external image layer is used to define the layer where the additional (external) image for Click2Sign / Draw2Sign / Type2Sign should be rendered. It must be defined in the layout for these three signature types.

Please also see the next sample for more information about possible configurations:

```
<?xml version="1.0" encoding="utf-8"?>
<SignatureRenderingLayoutConfiguration>
  <Colors>
    <Color id="black" a="255" r="0" g="0" b="0" />
    <Color id="red" a="255" r="255" g="0" b="0" />

Electronically signed with eSignAnyWhere

Prüfinformationen Hinweis

Die Prüfung der Signatur kann auf ... vorgenommen werden.
Die Signatur erfüllt die Voraussetzungen an eine fortgeschrittenen elektronische Signatur gem. eIDAS-VO.

i Note that it is required for that layout, to define the signature fields in a size fitting to the imprint (which is almost the full width of the page) - and that the aspect ratio of the stamp field is almost matching the background layer's size. If that is not considered, the font may be shifted and placed outside the borders.

It might be relevant to adjust the hint text depending on organization language and legal framework considered for the text. For signature types offering a qualified electronic signature, the text can be changed to something letting the user know that the signature is a qualified one, and an idea could be to reference the applicable national law here.
